Question 1 - Arra	ys and Recursion [23
-------------------	--------------------	----

Examine the Q1.py module listed at the end of the test and answer the following questions.

(i)	Write down the exact output produced when the Q1.py. module is executed.	[7] - -
	['b', 'a', 't'] #[1] ['b', 'aa', 'ttt'] #[2] [[0, 0, 0], [0, 0, 0]][2] [[0, 0, 0, 0, 0, 0]][2]	
	Write Python code for the function mirror(arr1D) in the Q1.py module that arr1D as follows. This function changes arr1D to be twice its original length, whe additional elements added are a reflection of the original list. For example, in the P interpreter, it would behave as follows. >>> X=[1,2,3] >>> mirror(X) >>> print(X) [1, 2, 3, 3, 2, 1]	re the
		_
	def mirror(arr1D): for i in range(len(arr1D)-1,-1,-1): #2 arr1D.append(arr1D[i]) #2	
	#no return! #I	
	The function <code>boss(arr1D)</code> in the Q1.py module function is recursive. What recursive stopping case for this function?	is the
	len(arr1D) == 1 OR "when the list/array has one element in it".	-
(iv)	Explain clearly, briefly and in general what the boss (arr1D) function does.	[1]
	It outputs the maximum value in the list/arr given as input	-

Canc	as follows in the Python interpreter.	[2]
	<pre>import Q1.py print(Q1.boss([40,10,56,15]))</pre>	
5		
	nin, with reasons, what will happen if the function boss (arr1D) in the Q1.py modeled as follows in the Python interpreter.	dule [2]
	<pre>import Q1.py Q1.boss([])</pre>	
	finite recursion and/or RuntimeError [1] because the stopping case is never eached[1].	
(vii)Now the it	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers of the function tot (numbersL) and the same outputerative version on all inputs.	
(vii)Now the it be se	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers of the function tot (numbersL) and the same outputerative version on all inputs.	will
(vii)Now the it be se	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers on to the function.	will 5]
(vii)Now the it be se	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers into the function. [5] totRec (numbersL):	will 5]
(vii)Now the it be se	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers into the function. [5] totRec (numbersL):	will 5]
(vii)Now the it be se	write a recursive version of the function tot (numbersL) that has the same outputerative version on all inputs. You can assume that only non-empty 1D lists of integers into the function. [5] totRec (numbersL):	will 5]
(vii)Now the it be se def	write a recursive version of the function tot (numbersL) that has the same output erative version on all inputs. You can assume that only non-empty 1D lists of integers in to the function. [5] totRec (numbersL): """Returns the sum of the elements in a list of numbers""" tRec(numbersL): Returns the sum of the elements in a list of numbers"""	will 5]
(vii)Now the it be se def	write a recursive version of the function tot (numbersL) that has the same output erative version on all inputs. You can assume that only non-empty 1D lists of integers on to the function. [5] totRec(numbersL): """Returns the sum of the elements in a list of numbers""" tRec(numbersL):	will 5]

Question	2 _	Diction	nariae	and Files	[17]
Question	Z –	DICTIO	naries	and riles	; <i> </i>

Examine the Q2.py module listed at the end of the test and answer the following questions.

(i) Explain what happens if this program is executed and a file called "input.txt" does exist in the current directory.	5 not [2]
The program crashes with a IOError	
(ii) Explain what happens if this program is executed and a file called "output.txt" does exist in the current directory.	s not [2]
The file is created in the current directory	
(iii)The file "input.txt" contains the following lines of text.	
hamburger 3	
coke 1	
hamburger 2	
chips 5	
coke 3	
Write down the exact contents of the file "output.txt" after the program has executed.	[4]
chips 5	
coke 4	
hamburger 5	
#2 marks for correct words on correct lines, #2 marks for correct	ect

(iv)Write a function FlipFile(filename) that reverses the contents of a file. For examp FlipFile("input.txt") would change the contents of "input.txt" to the t following lines of text.	
coke 3	
chips 5	
hamburger 2	
coke 1	
hamburger 3	
[9]	
	

def FlipFile(filename):

```
file1=open(filename,'r') #1

allData=file1.readlines() #1

file1.close() #1

file1=open(filename,'w') #1

for i in range(len(allData)-1,-1,-1): #2

print(allData[i],file=file1,end=") #2 - if end=" not there, ignore

file1.close() #1
```

Code examples for the test – you may detach this sheet.

Question 1

```
#Module Q1.py
def tot(numbersL):
    """Returns the sum of the elements in a list of
numbers"""
    sum=0
    for n in numbersL: sum+=n
    return sum
def amplify(arr1, arr2):
    if len(arr1)!=len(arr2): return
    for i in range(len(arr1)):
        arr1[i] *=arr2[i]
def create(rows, cols):
    arr2D=[]
    for i in range (rows):
        arr2D.append([])
        for j in range(cols):
            arr2D[i].append(0)
    return arr2D
def boss(arr1D):
    if len(arr1D) ==1:return arr1D[0]
    val=boss(arr1D[1:])
    if val>arr1D[0]: return val
    return arr1D[0]
def mirror(arr1D):
    #Code missing here
chars=['b','a','t']
X = [1, 2, 3]
print(chars)
amplify(chars, X)
print(chars)
print(create(2,3))
print(create(X[0], tot(X)))
```

Question 2

```
#Module Q2.py
file1=open("input.txt",'r')
weights={}
for line in file1:
    values=line.split()
    word, number=values[0], eval(values[1])
    if word!='':
        if word not in weights:
            weights[word]=number
        else:
            weights[word]=weights[word]+number
file1.close()
file2=open("output.txt",'w')
for w in weights:
        print(w, weights[w], file=file2)
file2.close()
```
